

Murder in Midsize Cities

Community Research Council
Chattanooga, Tennessee
August 2006

About the Community Research Council

The Community Research Council (CRC) is a 40 year old non-profit organization based in Chattanooga, Tennessee. CRC is the leading source of independent policy research and data analysis for foundations, non-profit and government agencies in the Chattanooga region. Its work focuses on five broad areas of urban policy:

- Crime and Public Safety
- Health
- Economic and Community Development
- Urban Governance
- Youth and Education

CRC's work is funded by grants from the Alfred P. Sloan Foundation, AcademyHealth, the Benwood Foundation, the Community Foundation of Greater Chattanooga, the Lyndhurst Foundation, the Public Education Foundation and the United Way of Greater Chattanooga.

About the Author

David Eichenthal is the President and CEO of the Community Research Council. Prior to joining CRC, Mr. Eichenthal served as Director of the Office of Performance Review and City Finance Officer for the City of Chattanooga. Mr. Eichenthal continues to serve as the Chair of the City's \$200 million General Pension Plan.

Before coming to Chattanooga in 2002, Mr. Eichenthal spent a dozen years in New York City and State government. He was the Chief of Staff to the New York City Public Advocate, the City's second highest elected official.

Mr. Eichenthal holds a degree in Public Policy Studies from the University of Chicago and a law degree from New York University School of Law. His articles have been published in the New York Daily News, New York Newsday, the Chattanooga Times Free Press, Justice Quarterly and the Prison Journal. He has taught public policy, public administration and criminal justice courses as an adjunct faculty member at New York University, Georgia State University, Baruch College and the University of Tennessee at Chattanooga. Mr. Eichenthal also serves as a member of the Board of Directors of the Center for Employment Opportunities, a national leader in the effort to provide immediate, comprehensive, and effective employment services for men and women returning from prison.

Executive Summary

Between 2000 and 2005, murder and non-negligent homicide in midsize cities (cities with a 2000 population between 100,000 and 300,000) has increased by 22.2%. The rate of increase was two and a half times the rate of increase for the nation as a whole (8.5%) and more than fifty percent higher than that of large cities (cities with a population between 300,000 and one million): in U.S. cities with a population of more than one million, the number of murders actually declined between 2000 and 2005 by 6.1%.

The increase in murder in midsize cities is not the result of a one year spike. By 2005 -- when murder nationally increased by 4.8%, the largest one year increase in murder since 1991 -- 36% of the net increase in homicides since 2000 had already taken place. By comparison, more than 77% of the increase in homicides in large cities was the result of a one year increase between 2004 and 2005.

Not all midsize cities have experienced an increase in murders. In fact, in one-third of midsize U.S. cities, there was no change or a decline in murders between 2000 and 2005. Twenty one midsize cities with the highest net increase in murders between 2000 and 2005 accounted for almost 80% of both the five year increase and one year increase in midsize murders.

Seven midsize cities that have experienced the highest net increase in murder since 2000 accounted for 38.7% of the net five year increase and just over half of the one year increase.

Nationally, in 2005, the average murder rate in midsize cities was 8.5 per 100,000 residents, less than the rate for large cities (13.7) and cities of more than one million (13.6). The seven midsize cities with the highest net increases in murder each had 2005 murder rates that significantly exceeded that national midsize city rate:

Table 1
Highest Net Increase in Murders – Midsize Cities

City	2005 Murder Rate	Net Increase in Murders, 2000 - 2005
Newark	35.5	39
San Bernardino	31.3	26
Birmingham	42.8	25
Jersey City	15.8	21
Buffalo	19.1	17
Portsmouth, Va.	21.9	16
St. Petersburg, Fl.	12.1	16

The geographic diversity of these seven cities is reflected in the larger

group of 21 midsize cities with the greatest net increase in murder: six

are in California, three are in Virginia, two are in Alabama, New Jersey and New York and there is one city each in Arkansas, Florida, Massachusetts, Michigan and Pennsylvania.

Several factors may explain the increase in murder in these 21 cities. Six of the cities grew in population by more than 10% between 1990 and 2000 and Census estimates suggest that they have continued to grow over the last five years. On the other hand, eight of the twenty one cities have experienced sustained population loss since 1990.

On average, 20.3% of individuals in these 21 cities were living in poverty in 2000: by comparison, the poverty rate average for the nine largest cities was 18.9% and 12.4% for the nation as a whole. Among the seven cities with the highest increase in murder, four – Newark (28.4%), San Bernardino (27.6%), Birmingham (24.7%) and Buffalo (26.6%) – had poverty rates more than double the national rate.

Based on 2000 Census data, the 21 cities had a youth cohort (age 10 to 19 in 2000 and 15 to 24 in 2005) average of 15.2% of their total population. By comparison, this youth cohort accounted for 14.1% of the population of the nine largest cities and 14.5% for the nation as a whole. Of the seven cities with the highest increase in murder, two had youth cohorts higher than the national average – Newark (15.3%) and San Bernardino (18.2%).

Finally, the non-white population of the 21 cities was an average of 58.5%. By comparison, the average non-white population for the nine largest cities was 62.1% and 30.9% nationally. Of the seven cities with the highest increase in murder, four had non-white majorities and three had white majorities.

Why Focus on Murder?

Murder and non-negligent homicide is one of the least common criminal offenses. In fact, fourteen U.S. cities with population greater than 100,000 had one or no murders during 2005.¹ But for a variety of reasons, murder is perhaps the best means of looking at crime – particularly violent crime – across different jurisdictions.

Criminologist James Fox has noted that “[N]ot only is homicide, because of its severity, of greatest concern to lay persons and experts alike, but available data on this offense are unmatched in terms of quality, consistency and coverage. At a national level, no other crime is measured as accurately and precisely...it is a fairly reliable barometer, relatively unaffected by non uniformity in law enforcement definition and processing.”²

¹ All data on murder is from the recently released preliminary Uniform Crime Report for 2005 and the Uniform Crime Reports for preceding years, all of which are available at www.fbi.gov.

Detailed tables are found in Appendices A (Midsize Cities), B (Large Cities) and C (Cities with Population of One Million or More).

² James Alan Fox, “Demographics and U.S. Homicide,” in *The Crime Drop in America*, ed. Alfred Blumstein and Joel Wallman, 2000.

Why Focus on Midsize Cities?

The experience of the 1990s made clear that crime patterns and trends are not uniform across place. Significant growth and decline in discrete geographic areas can drive national crime data. This is particularly true in the area of murder.

For example, both the record levels of violent crime nationally and the historic decline during the 1990s were driven by cities, particularly the nation's largest cities. Professor Alfred Blumstein has noted that "examination of the trends over time offers a compelling picture of the saliency or large cities, both in the rise of homicide in the 1980s and the decline during the 1990s." Blumstein noted that in 1991, New York City's homicides accounted for nine percent of the national total.³

Midsize cities deserve special focus because there are both more midsize cities and more Americans living in midsize cities than in the larger cities that typically drive thinking about urban America and urban policy.

Focusing on the fifty states and the District of Columbia, there were 9 cities with a population of more than one million (super-sized cities), 48 cities with a population of 300,000 to 1 million (large cities) and 182 cities with a population of 100,000 to

300,000 (midsize cities).⁴ Residents of midsize cities also outnumber the residents of large and super sized cities (cities with population exceeding one million) – there are 28.3 million residents of mid size cities, compared to 23.9 million residents of large cities and 22.9 million residents in super-sized cities.

Table 2
U.S. Cities by Population

	Number of Cities	Total Population
Mid Size Cities	182	28,257,477
Large Cities	48	23,927,469
Super-Sized Cities	9	22,947,966

The Rise of Murder in Midsize Cities

After the murder rate in the United States reached a record high in 1991, the nation enjoyed an eight year period of significant and dramatic decline in both the number of murders and the murder rate. The number of murders increased for the first time since 1991 in 2000, with the number of murders and non-negligent homicides rising from 15,522 to 15,586 – an increase of less than one percent. Throughout this decade, the number of murders had generally reached a new plateau. The number of murders increased in 2000 (.4%), 2001 (2.8%), 2002 (1.0%) and 2003 (1.7%) and declined in 2004 (-2.4%).

³ Alfred Blumstein, "Disaggregating the Violence Trends," in *The Crime Drop in America*.

⁴ Population data is from the 2000 Census. An additional 4 cities of more than 100,000 residents are located in Puerto Rico – San Juan, Bayamon, Carolina and Ponce.

In July, preliminary data released by the Federal Bureau of Investigation indicated a 4.8% one year increase in murder and non-negligent homicide in 2005 – the largest one year increase since 1991.

The preliminary data on murder for 2005 noted significant variation in the rate of increase based on categories of city size, with double digit increases in the number of murders in cities in the 50,000 to 99,999 population range (12.4%) and the 100,000 to 249,999 range (12.5%), and a 9.4% increase for

cities between population between 250,000 and 499,999.

For midsize cities, the apparent spike in murder in 2005 was actually the continuation of a five year increase that has produced a 22.2% increase in murder. The rate of increase was two and a half times the rate of increase for the nation as a whole (8.5%) and more than fifty percent higher than for large cities (cities with a population between 300,000 and one million): in U.S. cities with a population of more than one million, the number of murders actually declined between 2000 and 2005 by 6.1%.

Table 3
Increase in Murder by City Size⁵

	Total 2005 Murders	2004 – 2005 Change	2000 – 2005 Change	2000 – 2005 Change (%)
Population > 1 million ⁶	2745	+1	-177	-6.1%
Large Cities ⁷	2402	+222	+286	+13.5%
Midsize Cities	2282	+265	+414	+22.2%

⁵ City population is based on data from the 2000 Census. While the Census Bureau generates annual estimates of population for U.S. cities, they frequently result in population undercounts – especially in urban areas. See, e.g. Bruce Katz and Alan Berube, “Don’t Read Too Much into Census Numbers,” *Journal Sentinel*, July 19, 2005. See, also, Greg Harper, Chuck Coleman and Jason Devine, “Evaluation of 2000 Subcounty Population Estimates,” Population Division – U.S. Census Bureau, Working Paper 70, May 2003 (comparative analysis of population estimate and 2000 Census finds that a mean absolute percent error rate of 4.3 for subpopulations of 100,000 or more: in more than 70% of the cases, the error reflected a lower than actual population).

⁶ The appendices contain city by city charts for all categories of cities.

⁷ Comparative data was available for thirty six out of forty eight large cities and 161 out of 182 midsize cities. Aggregate data reflects only those cities where comparable data was available.

The increase in murders in midsize cities is part of a trend that was in place before the one year national spike in 2005. For example, between 2000 and 2004, murder had increased in large cities by just 3.0%. By 2004, midsize cities had already experienced a 8% in murders since 2000.

Not all midsize cities are alike, however. Fifty nine midsize cities either experienced no increase in murder since 2000 or had a reduction in murder. Twenty one midsize cities, with the highest net increase in murder over five years, accounted for approximately 80% of the increase in midsize city murders since 2000 and close to 70% of the increase over the last year.

Midsized City Murder Rates

While murder in midsize cities appears to be driving the increase in murder nationally, on average, midsize cities still have murder rates below those of both large cities and cities of one million or more.

Among 161 midsize cities, murder rate per 100,000 in 2005 averaged 8.5 – with a range from 0 to 56.4. Among large cities, the average was 13.7 per 100,000 – with a range from 2.9 to 37.6 per 100,000. Among those cities with a population of more than one million, the murder rate was

13.6 – with a range of 4.2 to 24.8 per 100,000.

While midsize cities as a category have a lower average rate than other categories of cities, the 21 midsize cities that account for the bulk of the

increase in murder in midsize cities generally had a significantly higher murder rate, in all but one case exceeding the average rate for all midsize cities and in thirteen out of twenty one cities at a level double the midsize city average.

Moreno Valley	CA	7.7

What Do the 21 Midsize Cities with High Net Increases in Murder Have in Common?

The 21 cities are not geographically concentrated: six are in California, three are in Virginia, two are in Alabama, New Jersey and New York and there is one city each in Arkansas, Florida, Massachusetts, Michigan and Pennsylvania. Nine, however, are clustered in or near three metropolitan areas New York

(Jersey City and Newark), Los Angeles (Glendale, Lancaster, Moreno Valley, Oxnard and San Bernardino) and Norfolk (Norfolk and Portsmouth). These metropolitan areas, however, also have cities that sustained reductions: for example, both New York and Los Angeles experienced continued reduction in murder and Newport News (also in the Norfolk MSA) had the largest net five year reduction in murders of any midsize city.

Murder in 21 Midsize Cities

Population change could have an effect on murder. A city's murder rate could remain the same, but could experience more murders with an increase in population. On the other hand, cities with a declining population may have a declining employment base as well. Given the relationship between crime and employment opportunity, this might also explain part of the increase in murder.⁸

Six of the twenty one cities have experienced population growth of more than ten percent between 1990 and 2000 and have reportedly continued population growth between 2000 and 2005: North Las Vegas (142.1%/53.0%), Lancaster (22%/12.9%), Moreno Valley (19.9%/25.3%), Oxnard (19.8%/7.8%), Stockton (15.6%/17.7%) and San Bernardino (12.9%/7.1%).⁹

Eight of the twenty one cities lost population during the 1990s and have reportedly continued to lose population since 2000: Flint (-11.2%/-5.1%), Buffalo (-10.8%/-4.4%), Norfolk (-10.3%/-1.04%),

Birmingham (-8.7%/-4.7%), Rochester (-5.1%/-4%), Portsmouth (-3.2%/-0.4%), Springfield (-3.1%/-0.2%) and Richmond (-2.6%/-2.0%).

High poverty rates may also explain some of the increasing murder rates in these cities.¹⁰ On average, 20.3% of individuals in these 21 cities were living in poverty in 2000: by comparison, the poverty rate average for the nine largest cities was 18.9% and 12.4% for the nation as a whole. Among the seven cities with the highest increase in murder, three – Newark (28.4%), San Bernardino (27.6) and Buffalo (26.6%) – had poverty rates more than double the national rate. Nevertheless, cities like New York and Los Angeles had poverty rates of 22.1% and 22.9% respectively and still sustained declines in murder during the last five years.

There may also be a relationship between violent crime and both age and race. As Fox notes, “[A]ll else equal, violent crime rates rise as the percentage of the population in the more violence prone age-race-sex groups (that is, young adult males, especially minorities) expands.”¹¹

Based on 2000 Census data, the 21 cities with the highest net increases in murder had a youth cohort (age 10 to 19 in 2000 and 15 to 24 in 2005) average of 15.2% of their total population. By comparison, this

⁸ See, Ted Chiricos, “Rates of crime and unemployment: An analysis of aggregate research evidence,” *Social Problems*, 1986, cited in Bushway and Reuter, “Labor Markets and Crime Risk Factors” in *Preventing Crime* (2002): “Chiricos does find...that at lower levels of aggregation (states, counties and cities), roughly half of all reported studies show a positive and statistically significant relationship between employment and crime...”

⁹ Data on population are from both the 2000 Census and the most recent subcounty population estimates released by the Bureau of the Census. See, footnote 5 for a discussion of the significance of population estimates.

¹⁰ See, e.g. Robert Sampson and Janet Lauritsen, “Violent Victimization and Offending” in Reiss and Roth, eds., *Understanding and Preventing Violence, Volume 3* (1994).

¹¹ See, Fox, *ibid.*

youth cohort accounted for 14.1% of the population of the nine largest cities and 14.5% for the nation as a whole. Of the seven cities with the highest increase in murder, two had youth cohorts higher than the national average – Newark (15.3%) and San Bernardino (18.2%).

Finally, the non-white population of the 21 cities was an average of 58.5%. By comparison, the average non-white population for the nine largest cities was 62.1% and 30.9% nationally. Of the seven cities with the highest increase in murder, four had non-white majorities and three had white majorities.

The Need for Further Study

Just as the dramatic national reduction in murder in the 1990s was led by declines in the nation's largest cities, a reversal of the increase in murder during this decade will only occur with declines in those midsize cities where murder has been on the rise.

Many demographic factors that could explain an increase in murder exist in some of the twenty one midsize cities that account for 80% of the overall increase in murder in midsize cities. But they also appear to exist in many of the super size cities where murder had continued to decline. In fact, in places like the New York and Los Angeles metropolitan areas, murder *does* appear to know boundaries – with declines in the largest cities and increases in surrounding midsize cities.

This report is not exhaustive. Many other factors may be contributing to the rise of murder in midsize cities. In particular, it may be worth exploring localized strategies at crime prevention – both through more effective policing and other means. Different approaches on the local level, as opposed to factors such as state correctional policies, may help to explain the anomalous situation of neighboring cities experiencing different trends.
